

# YOUR GUIDE TO HACCP

Regulatory Services, Trafford Council, Trafford Town Hall, Talbot Road, Stretford, M32 0TH

Telephone: 0161 912 4509 Email: environmental.health@trafford.gov.uk www.trafford.gov.uk

Page 1 of 57 26/10/2017 Tdoc200

### Introduction

Trafford Metropolitan Borough Council's Environmental Health Team has developed this document to help food businesses produce their own HACCP system (Hazard Analysis Critical Control Points).

The examples given in this booklet should be used as a general guide to the type of hazards that should be considered when carrying out your HACCP. Remember every food premises is different and therefore additional hazards may be present in your business so do not use the guide as an exhaustive list.

Persons responsible for developing and maintaining the business's food safety procedures, based on HACCP principles, must have received adequate training.

### What is HACCP?

HACCP stands for "Hazard Analysis Critical Control Points". It is an internationally recognised and recommended system of food safety management. It focuses on identifying "critical points" in the process where food safety problems (or hazards) could arise, and putting steps in place to prevent things going wrong.

### Why is this different from Hazard Analysis?

EC Regulations have became law in the UK from 1<sup>st</sup> January 2006. It is the responsibility of food businesses to ensure that they comply with this legislation.

The Food Safety and Hygiene (England) Regulations 2013 apply to ALL food businesses, including caterers, primary producers, manufacturers, distributors and retailers. These replace the existing Food Hygiene and Temperature Control Regulations as well as the Product Specific Regulations, which currently cover those who produce meat, dairy and fish products, for example.

### What does the law require?

Food business operators must put in place, implement and maintain a permanent procedure or procedures based on the principles of Hazard Analysis Critical Control Points (HACCP).

Food business operators will have to ensure that they have an appropriate written food safety management system in place, taking into consideration the size and nature of their business.

### **Using this document**

Producing your HAACP food safety management system involves looking at the operations in your business step by step, from the delivery or purchase of ingredients through to service of the food to a customer. At each step hazards will exist that require some form of control. Many of these controls will be simple and will have been in place for years. Other controls might require new procedures putting in place.

**Step One** – Identify hazards that must be prevented, eliminated or reduced to acceptable levels. It is usually helpful to list the steps in your food business from purchasing raw ingredients through to service or sale of the food and list the hazards at each step.

**Step Two** – Identify critical control points at the steps which control is essential to prevent or eliminate a hazard or to reduce it to an acceptable level. For example, where this is the final step in the process which would kill or reduce bacteria to an acceptable level. See guidance later in the booklet if you are unsure of what a critical control point is.

**Step Three** – Establish critical limits at critical control points. For example the minimum temperature at which you are satisfied food has been thoroughly cooked, the maximum temperature your refrigerator can operate at to keep high risk food safe.

**Step Four** – Establish and implement effective monitoring procedures at critical control points. These could include checking delivery temperatures of high risk food, checking refrigerator and freezer temperatures, and the temperature of cooked and reheated food and food kept in hot holding.

**Step Five** - Establish corrective action when monitoring indicates the critical control point is not under control. For example, if it is found that a refrigerator is operating at temperatures above the acceptable temperature what action would be taken?

**Step Six.** – Establish procedures to verify that the above measures are working effectively. For example, temperature monitoring sheets should be signed off by a Manager on a regular basis to ensure they have been completed correctly and probe thermometers should be calibrated regularly to ensure they are working correctly.

**Step Seven** – Establish documents and records appropriate to the nature and size of the business.

Page 3 of 57 26/10/2017 Tdoc200

### STEP ONE

### What is a Hazard?

A hazard is anything that could cause harm.

Hazards must be identified for all steps in the food activities.

The hazards of particular concern when looking at a hazard analysis are:

PHYSICAL: (e.g. Foreign objects)

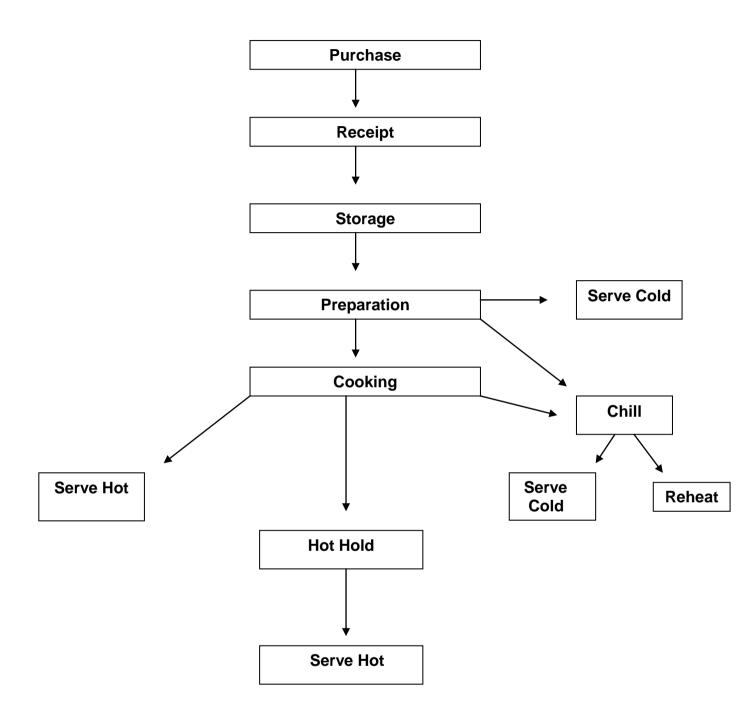

CHEMICAL: (e.g. cleaning material residues, machine oil)

MICROBIOLOGICAL: (e.g. PRESENCE of micro-organisms\* /toxins SURVIVAL of micro-organisms / toxins GROWTH of micro-organisms by – People Equipment Environment

Page 4 of 57 26/10/2017 Tdoc200

<sup>\*</sup>Micro-organisms include bacteria, viruses, fungi and moulds. Some of theses cause food poisoning either themselves or by forming toxins (poisons) in the food.

# Flow Diagram of Operations in a Food Business

### **STEPS TWO & THREE**

### What is a Critical Control Point?

Once you have identified the hazards, you then have to decide which of these points, if not controlled, will make the food unsafe to eat. Where you have identified a CCP you will then need to carry out simple checks to ensure that food is always within acceptable limits.

# EXAMPLES OF CRITICAL CONTROL POINTS

CRITICAL CONTROL POINT	WHAT	HOW IS MONITORED	CRITCAL LIMITS
CCP 1	READY TO EAT FOOD STORED IN THE REFRIGERATOR	TEMPERATURE OF REFRIGERATOR	0 - 8°C
CCP2	COOKING FOOD TO REQUIRED TEMPERATURE	VALIDATED COOKING METHOD, PROBE THERMOMETER	JUICES RUN CLEAR FOR MEATS OR CENTRE TEMPERATURE ABOVE 75°C
CCP3	HOT HOLDING OF MEAT PIES	TEMPERATURE MONITORING EVERY TWO HOURS	TEMPERATURE MUST BE AT LEAST 63°C. IF FALLS BELOW THIS, THE FOOD MUST BE SOLD WITHIN 2 HOURS

Page 6 of 57 26/10/2017 Tdoc200

### AREAS TO CONSIDER WHEN CARRYING OUT HACCP

Note – The following are suggested questions for you to consider, but it is not meant to be an exhaustive list.

### **PURCHASE**

Are your suppliers reliable?

Do you check that food handlers are observing hygienic practices when you purchase food from shops?

### **RECEIPT**

### Food delivered to the premises

Are food deliveries checked for temperature, intact packaging and use by dates?

Is raw meat kept separately to other foods?

What procedures are in place if food is not at the right temperature, out of date or has damaged / dirty packaging?

What records are kept of deliveries? (See attached record sheets)

How quickly must chilled, frozen and dry store food be put away after it arrives on the premises?

### Food collected from a shop

How do you ensure that chilled and frozen foods are kept at a safe temperature in the time taken to transport the food to your premises?

What precautions do you take to prevent cross contamination during transit?

### **DRY STORAGE**

How do you ensure good stock rotation?

What rules are in place to prevent contamination of bagged food once opened?

What checks are made to look out for signs of pest infestations e.g. gnawed bags and containers, split items, droppings.

### REFRIGERATED / FROZEN STORAGE

What is the maximum temperature your refrigerators and freezers are allowed to operate at?

What checks are made to ensure that the food in refrigerators and freezers remains below the required maximum temperature?

Who is responsible for checking the temperatures?

Is a record made of temperature checks? (See attached record sheets)

What steps are taken if the temperature is too high?

How are raw and cooked / ready to eat foods separated in the refrigerator and freezer?

How do you ensure good stock rotation of the food in the refrigerator and freezer?

Do you set a maximum storage date for foods stored in the refrigerator and freezer, after which it must be thrown away?

### **DEFROST**

Where and how is food defrosted?

What precautions are in place to prevent contamination?

How soon must ready to eat / cooked food be consumed after defrosting?

How soon must raw food be cooked following defrosting?

What special precautions do you take to clean down equipment and contaminated areas after dealing with defrosted raw meats etc...?

Is food dated to show a use by date following defrosting?

### **PREPARATION**

Have you designated separate work areas to prevent cross contamination between raw and cooked foods? If not, what procedures are in place for separation by time?

Do you use different coloured chopping boards, knives etc. to reduce cross contamination of cooked foods by raw foods?

How do you minimise the time that food, which will support bacterial growth, is kept at room temperature?

What personal hygiene rules are in place to prevent staff contaminating food?

Is all equipment suitable and in good repair? Could certain items be replaced with better alternatives (e.g. food grade plastics rather than poor quality glass, commercial rather than domestic equipment)?

Are cleaning chemicals used in preparation areas and stored properly and without risk of contaminating food?

Do sanitisers meet the British Standards? (BS EN 1276 and BS EN 13697)

Are there unnecessary items in the preparation area which could contaminate food (e.g. drawing pins, paper clips etc.)?

### **SERVE COLD**

What rules are in place to ensure cold foods, ready for service, are served quickly from the refrigerator?

What is the maximum time food can be left at room temperature prior to service to customers?

If cold foods are not to be served quickly are they placed in a refrigerator?

What precautions do you take to prevent contamination of cold food during service (e.g. no/minimum hand contact)?

What precautions are taken to prevent customers contaminating ready to eat food on display?

### COOK

If a probe thermometer is not used to check hot food temperatures, how do you ensure thorough cooking?

What is the minimum temperature you accept for cooked foods and what rules are in place if the food has not reached that temperature?

If you do not temperature check every food item, which items should be checked?

How do you disinfect the probe thermometer before taking the temperatures?

Who is responsible for taking temperatures of cooked foods?

Do you check the accuracy of the probe thermometer on a regular basis?

Do you record the temperature of cooked foods? (See attached record sheets)

### COOL

Which foods are cooked and subsequently cooled?

What is the maximum time you keep cooled food in the refrigerator/freezer before it has to be thrown away? How do you know how old the food is?

Where does cooling take place?

What precautions do you take to prevent food which is cooled from being contaminated?

Do you date code food before placing it in the refrigerator/freezer?

What is the maximum time food is left out before placing it in the refrigerator/freezer?

### **REHEAT**

Have all food handlers been instructed not to reheat food more than once?

What is the minimum temperature you accept for reheating foods, and what rules are in place if the food has not reached the minimum acceptable temperature?

Which reheated food temperatures do you check? Are these temperatures recorded? (See attached record sheets)

Who is responsible for taking these temperatures?

If you do not temperature check every food item, which items should be checked?

### **HOT HOLD**

What foods are held hot after cooking?

What is the minimum temperature of hot held foods?

When and how do you take the temperature of hot held food?

Do you record temperature readings? (See attached record sheets)

Who is responsible for taking the temperature of hot held foods?

What happens to the food if it is found to be below the correct temperature?

### **SERVE HOT**

What is the maximum time food can be left at room temperature before serving to customers?

### **DELIVERY**

Where is high risk food stored before delivery?

What type of food is delivered?

How long is food in the vehicle for?

How is it ensured that hot and cold high-risk foods stay within the correct temperature limits?

### **OTHER MATTERS**

### **CLEANING**

What cleaning chemicals do you use on the premises?

Detergent:

Disinfectant:

Sanitiser:

Where are these chemicals stored?

Do you have a cleaning rota or schedule?

Who checks that the cleaning has been satisfactorily carried out?

Do you use different coloured cleaning cloths for raw and cooked processes to prevent cross contamination whilst cleaning?

How do you prevent your cloths causing contamination of food surfaces?

How do you ensure the contact time is being applied and the product is being used correctly?

You can check whether your sanitiser product complies with the British Standards, (BS EN 1276 and BS EN 13697), and the correct usage and contact times by visiting www.disinfectant-info.co.uk

### **STAFF TRAINING**

Do you set a minimum training requirement for food handling staff within a specified time scale?

Do new staff undertake induction training?

Do you keep a record of staff training?

What arrangements have/will be made to draw this document to your food handlers' attention?

### **WASTE**

Are waste containers in the premises suitable?

Is waste stored outside in rigid bins with close fitting lids in a clean area awaiting regular collection?

### PEST CONTROL

Are your premises adequately pest proofed?

Do you regularly check all your premises and equipment on a regular basis for signs of pests?

Can staff recognise signs of pest problems? Would these be reported to management immediately?

Do you use the services of a professional pest control company to bait your premises and help you monitor for signs of pest problems?

If you have an "insectocutor" is it emptied and serviced on a regular basis?

### **FITNESS TO WORK**

Are staff screened, prior to employment, for any illness or condition that may give rise to food related illness?

Do staff sign a "Fitness To Work" screening questionnaire? (See Annex)

Do you maintain a staff sickness log?

Are staff made aware of conditions of ill health in which they should not handle food?

STEP	HAZARD	CONTROLS	MONITORING & RECORDING	CORRECTIVE ACTION
Purchase of raw ingredients	Food could be contaminated with pathogens, toxins, spoilage organisms, chemicals or foreign bodies	Select foods which are not hazardous  Only use reputable suppliers (if food is not available from usual supplier, only use another one from the approved supplier list)	Audit supplier's premises (if applicable) If local producers /suppliers ask for HACCP documentation  Use historical data, have ongoing problems been identified, are they still outstanding or have they been rectified.	Avoid /replace unsatisfactory suppliers  Send letters to suppliers regarding on going issues.

STEP	HAZARD	CONTROLS	MONITORING & RECORDING	CORRECTIVE ACTION
Receipt of raw ingredients	Delivery of contaminated food. e.g. raw & cooked food not separated	Delivery specification  Food delivered in a suitable clean vehicle and be stored in	Food handler Visual checks Appearance Fitness	Reject any contaminated food, e.g., blown cans, badly damaged packaging, evidence of pests, thawing
High risk food Dry food Frozen food	Delivery of food from unapproved sources	suitable containers and are adequately covered. Packaging should not be contaminated by anything and	Absence of pests Check approved supplier Check & record temperature of delivery	food  Reject deliveries of food out
Low risk food	Food not delivered in suitable containers or not covered, at risk of contamination from	raw food should have been stored away from high risk food and packaging.	vehicle Record time of delivery Check date code	of specified temperature limits
	physical contaminants		Report any problems to manager	Report rejected food to the manager.

Preparation – Raw meat	Cross contamination with bacteria from equipment being used for both raw and cooked	Do not wash raw meat or poultry. Any items used for raw meat (boards, knives, utensils, containers) should be	Staff training Observe practices Management audit	Re-train staff
	/ ready to eat foods	designated for raw meat only or cleaned in a dishwasher.		Destroy any potentially contaminated food Undertake a 2 stage clean
	Cross contamination with bacteria from surfaces or by preparing at the same time as other foods	Use a designated area for preparation of raw meats or prepare at a different time to other foods. Clean and sanitise raw meat areas immediately afterwards and before using area for other foods, using a 2 stage clean (hot soapy water first and then a British Standards approved	Cleaning schedule	Re-wash any potentially contaminated food equipment
	Cross contamination with bacteria by staff handling practices or	sanitiser. Ensure contact time of sanitiser is applied.  If possible, designate staff to deal with raw meat preparation only. If not, prepare raw meat		
	Cross contamination with bacteria from staff clothing	at a separate time and thoroughly wash hands with hot soapy water before handling other foods.  Wear a designated raw meat apron or over clothing whilst		

Page 19 of 57 26/10/2017 Tdoc200

	Cross contamination from inadequately washed raw meat equipment	preparing raw meat. Remove before handling other foods  Wash all raw meat items in a dishwasher where possible Where this is not possible, use anti-bacterial cleaning liquids. Wash raw meat equipment separately and after other equipment. Clean and sanitise the sink afterwards.		
STEP	HAZARD	CONTROLS	MONITORING & RECORDING	CORRECTIVE ACTION
Preparation (Thawing)	Inadequate time for thawing resulting in undercooking and survival of bacteria  Contamination of high risk ready to eat food	Follow manufacturer's instructions for thawing (Advice from supplier on joints of meat)  Ensure thawing of raw meat is carried out away from high risk	Food handlers Check meat is thawed adequately and is pliable  Manager Audit the system	Continue thawing until thawing is complete  Issue instructions to food handlers  Use a separate thawing
	from thawing raw meats  Multiplication of food poisoning bacteria because of thawed food being left at ambient temperature	Allow sufficient time, remove from freezer the day before and store at the bottom of refrigerator if raw product. Stored thawed ready to eat products appropriately to avoid cross contamination.	Competency of food handlers  Observe practices	cabinet

Page 20 of 57 26/10/2017 Tdoc200

		Do not thaw raw meats or poultry in sinks or buckets of water.  Training of food handlers in correct procedures	Staff Training Observe practices	Clean and sanitise sinks, surrounding areas and equipment where raw meat has been thawed or contaminated water has been disposed of. Dispose of any potentially contaminated food.
STEP	HAZARDS	CONTROLS	MONITORING & RECORDING	CORRECTIVE ACTION
Cooking	Survival of food poisoning bacteria due to inadequate cooking/processing  Multiplication of food poisoning bacteria due to prolonged time at room temperature  Contamination introduced from tasting  Chemical contamination from unsatisfactory	Ensure food is cooked for appropriate time & to appropriate core temperature above 75°C (Include special cooking instructions or see recipe).  Ensure frozen joints/ poultry is completely thawed  Use clean spoons for tasting  Keep lids on pans and stir foods in pans regularly to distribute the heat	Food handlers  Use disinfected probe to check core temp & record  Visual check  Manager  Check cooking records  Periodic audit  Maintenance of equipment at regular intervals	Issue instructions to food handlers  Continue cooking until core temperature reaches 75, reject any unsafe product  Review cooking times/ recipes  Carry out cooking trials.

Page 21 of 57 26/10/2017 Tdoc200

Cooking of Raw meats	Cross contamination with bacteria from incorrect use of utensils or inadequate handwashing	If handling raw meats ensure you wash your hands, or use designated raw meat utensils such as tongs.  To turn the partly cooked meat, ensure the underside is cooked, then use a designated utensil such as a flat spatula which does not touch the raw (top) side of the meat.  Meats which are thoroughly cooked on both sides should be removed with designated cooked meat tongs or the flat spatula.		Dispose of any potentially contaminated foods. Re-train staff Provide correct equipment
STEP	HAZARDS	CONTROLS	MONITORING & RECORDING	CORRECTIVE ACTION
Cooling	Growth of food poisoning bacteria not destroyed during cooking  Germination of spores	Minimise weight & thickness of joints  Cool food rapidly, within 1½ hours or use a blast chiller.  Portion food or slice to cool quicker	Food Handlers  Check cooling times for high risk food  Record cooling times	Purchase a blast chiller (ideally)  Issue new instructions for food handlers  Reject unsatisfactory or contaminated product

Page 22 of 57 26/10/2017 Tdoc200

	Contamination from food poisoning bacteria, foreign bodies, chemicals or insects especially flying insects.	Decant sauces/ stews into shallow containers  Use iced water baths to speed up cooling process  Place in the chiller as soon as possible  Cool rice with running water or decant into shallow trays  Keep food covered & separate from raw food.	Managers Check records Visual observations	Reduce size & weight of the product  Carry out cooling trials  Purchase pre cooked cold meats.
STEP	HAZARD	CONTROLS	MONITORING & RECORDING	CORRECTIVE ACTION
Serving / Display	Growth of food poisoning bacteria, due to prolonged time at ambient temperature	Keep hot food hot above 63°C Keep cold food cold below 8°C Cold food on offer for sale can be displayed unrefrigerated for 4 hours and hot food displayed for 2 hours. At the end of this time food must be disposed of or cold food placed in the fridge and served. Colour code with time appropriately	Food Handlers  Check & record temperatures of refrigerated display or hot holding temperatures  Managers  Equipment maintenance  Check temperatures	Adjust temperature (Call maintenance engineer if necessary)  Replace equipment/ utensils  Hot food: remove & destroy food in danger zone for over 2 hours  Refrigerate food which has

Page 23 of 57 26/10/2017 Tdoc200

Contamination from equipment/ utensils  Contamination from	Sell food within shelf life  Minimise time buffet is at ambient  Use clean tongs  Provide sneeze screens	Periodic audit	been at the danger zone for 4hrs (Note: only one such period allowed).  Issue instructions for food handlers.
servers			
Contamination from packaging	Personal hygiene (handwashing)		
	Separation raw & cooked		
	Keep food covered.		

Page 24 of 57 26/10/2017 Tdoc200

# **Example of an E Coli HACCP System**

STEP	HAZARD	CONTROLS	MONITORING & RECORDING	CORRECTIVE ACTION
Purchase / Receipt	Cross Contamination	Raw foods and ready to eat foods are delivered separately by dedicated suppliers	Selection of reputable suppliers	Change suppliers
		Raw meat is delivered with other foods but is adequately segregated within the delivery vehicle  If probing raw meats, have a designated probe for raw meat only  Immediately dispose of raw meat packaging such as boxes to prevent re-use for ready to eat foods	Visual checks on receipt to ensure adequate segregation	Address issue with supplier. Change supplier if necessary  Dispose of potentially contaminated food
Storage	Cross Contamination	Raw meat is stored in a dedicated refrigerator or freezer  Raw meat is stored separately in a freezer and separately at the bottom of a refrigerator, to other foods		Dispose of any contaminated food  Ensure correct unit used  Re-train staff  Clean and Sanitise the unit

Page 25 of 57 26/10/2017 Tdoc200

Defrosting/ Washing	Cross Contamination via use of sinks	Raw meat should not be washed as it can spread bacteria	•	ose of any iminated food
		Raw meats are not to be defrosted directly in sinks (place in designated food container)	at the	est meats slowly bottom of a erator
		Raw meats are not to be defrosted in	, and	
		containers of water	water	ot dispose of used for sting in food
			the si	
Preparation	Cross contamination - surfaces and boards	Minimise the risk by buying pre prepared raw meats	conta	ose of any iminated food n and Sanitise
		Use a designated raw meat preparation area if possible. If not, have a system for separation by time		ain staff
		Use a designated chopping board for raw meat only		
		Equipment not to be dual used, particularly if not being cleaned in a dish washer		
		Store raw meat equipment separately		

Page 26 of 57 26/10/2017 Tdoc200

	Cross contamination  – Utensils and food containers	Sanitise the preparation area using a two stage cleaning method – hot soapy water followed by a British Standard approved sanitiser. Apply correct contact time.  Designate knives, utensils and food storage equipment for raw meats only. This is essential if they are not cleaned in a dishwasher. Do not dual use.	
Cooking	Cross contamination during cooking	Ensure designated cooking utensils are used for raw and cooked items  Keep raw and cooked items separated when cooking  Ensure probe thermometers are adequately disinfected if an item is probed when not fully cooked (using either alcoholic probe wipes or by placing probe in boiling water for minimum of 2 minutes)  Ensure food items that are cooked on one side and raw on the other, such as burgers, steak, chicken etc. are turned using appropriate equipment such as a spatula and not tongs, to prevent cross contamination via utensils	Dispose of any potentially contaminated food

Page 27 of 57 26/10/2017 Tdoc200

Slicing/ Packaging/ Weighing/ wrapping etc.	Cross contamination due to dual use of machinery	Ensure designated equipment is used, e.g. slicers, vacuum packers, weighing scales, one for raw meat and another for cooked and ready to eat foods  Store packaging for cooked and ready to eat foods away from raw meat areas  Use a designated cling film dispenser for wrapping raw meats	Dispose of any potentially contaminated food
Washing Up	Cross contamination via washing raw and cooked equipment together	Use a dishwasher. If you don't have a dishwasher, wash cooked and ready to eat equipment separately and before raw meat equipment. Clean and sanitise sinks and washing up bowls when finished. Ensure a two stage clean is undertaken.	
Cleaning	Spread of bacteria from inadequate cleaning processes Spread of bacteria via cloths	Avoid use of re-usable cloths if possible. Launder or replace cloths frequently if not possible. Use designated cloths for raw meat areas. Use disposable paper towel for sanitising Wash hands after handling raw meats	Clean any surfaces/equipment touched
Hand contact surfaces	Spread of bacteria from touching contaminated surfaces	Non hand operated taps where possible Clean and sanitise surfaces in raw meat areas after touching, e.g. taps, handles to equipment, light switches etc. Use of non-touch techniques	Dispose of any potentially contaminated food

Page 28 of 57 26/10/2017 Tdoc200

### **Advice for Complex Foods/Processes**

This page directs you to sources of advice for more complicated food processes/types.

### Sous Vide

Sous vide is a process which must be carefully controlled in order to ensure that the finished product is safe. This low temperature cooking method holds foods at temperatures which can allow the growth of bacteria, and therefore a time and temperature combination which is adequate to destroy bacteria, or an end point control must be applied, to ensure the safety of the food. Please call us on 0161 912 4509 or 1377 to request an information leaflet.

### **Vacuum Packaging**

Vacuum packing is a process which can help reduce growth of bacteria which require oxygen and allow a longer shelf life to be given to products. However it must be carefully controlled in order to ensure that conditions are not created which allow the growth of bacteria such as Clostridium Botulinum, which thrives without oxygen.

Vacuum packing of any products needs careful consideration in a HACCP plan in order to ensure you have the correct control measures to produce safe food.

A simple fact sheet on vacuum packing can be found here:

https://www.food.gov.uk/sites/default/files/multimedia/pdfs/publication/vacpack0708.pdf

Detailed guidance on vacuum packing can be found here:

https://www.food.gov.uk/sites/default/files/multimedia/pdfs/publication/vacpacguide.pdf

### **Rare Burgers**

You must not serve burgers which are pink or less than fully cooked unless you can validate that your process is safe. This involves the production of a specific HACCP system for the process. It should include procedures for selection of appropriate suppliers and their procedures to provide you with a carefully controlled raw product, your procedures for handling, preparing and cooking the product and your validation that the product complies with the Food Standards Agency Guidelines (i.e. either a 4 or 6 log reduction in bacteria in the end product).

Detailed advice can be found at:

https://www.food.gov.uk/sites/default/files/beef-burger-advice-industry.pdf

### **Stock Control**

If you do not have enough food in stock, then you could run out. However, if you have too much, you could end up loosing money by wasting the food. Therefore you should ensure that you have an adequate system for controlling stock.

Food may already have a use by date on the pack. If you do any of the following you may need to introduce additional stock control checks to ensure that the food you are serving is not sold past the date by which it should be used by.

### 1. Open packs of food and do not use it all at once

You need to establish a day dot system. This may include decanting food into another suitable container and putting a label on it with the date by which it should be used by. This date, for example, may not be the date on the original packaging, as it may state "once opened use within 3 days). A usual guide is that high risk food should ideally be used within 3 days of opening.

### 2. Prepare food in advance

Preparing food in advance of using it, is quite safe as long as it is cooked and cooled safely and then stored in a safe manner. This type of food should be stored in a suitable container and either labelled with the date it was prepared, and staff informed about how long this food can be safely kept for, or a date by which is should be used by. When determining this time, you should consider the safety and quality of the food at the end of the time period set. You could label food with both these dates.

### 3. Prepare food and freeze it.

Food should be labelled with the date it was prepared, the date it was frozen and the date it should be used by.

Once taken from the freezer and defrosted another date should be given to the product, which should be the date it should be used by once it has been defrosted.

### **Important**

It is vital that staff are trained in the system chosen, and that responsibility is given to everyone to check for use by dates. You should also ensure that staff are aware of what they should do if they find food past its use by date.

It is useful to document date code checks.

### **BASIC CLEANING SCHEDULE**

EQUIPMENT OR WORKTOP AREA TO BE CLEANED/DISINFECTED	FREQUENCY OF CLEANING/DISINFECTING	METHOD OF CLEANING/DISINFECTING	PERSON RESPONSIBLE FOR CLEANING

Page 46 of 57 26/10/2017 Tdoc200

#### NOTES ON CLEANING

**DETERGENT** – a chemical used to remove grease, dirt and other soiling such as food particles. Detergents may remove large numbers of micro-organisms but will not kill them

**DISINFECTANTS** – something which will reduce micro-organism numbers to a level which is safe and will not cause premature spoilage of food. Disinfection may be brought about by "disinfectant chemicals" or simply by applying heat e.g. by using very hot water

STERILISER – a chemical designed to kill micro-organisms

**SANITISER** – a chemical which combines the properties of detergents and disinfectants. It will therefore clean and disinfect surfaces.

#### WIPING CLOTHS

- Cloths can carry bacteria so it is essential that they are clean and changed frequently. Remember a cloth is only as clean as the last thing
  it was used on. Wherever possible, disposable cloths should be used.
- Where both raw and cooked foods are handled, different colour-coded cloths should be used.
- If you cannot avoid using re-usable cloths they must be disinfected (e.g. by boiling) at regular intervals.

#### **DEEP CLEAN**

Periodically, you will need to make special arrangements to carry out an intensive deep clean of difficult to access areas and equipment.

#### **GENERAL**

 Your Environmental Health Officer will be pleased to consider any draft document you produce to comment on its suitability or provide assistance.

Page 47 of 57 26/10/2017 Tdoc200

#### GOOD HYGIENE PRACTICE FOR FOOD HANDLERS

- 1. Wash and dry your hands:
  - before and after handling food: and
  - after going to the toilet
  - after coughing into the hand or using a handkerchief
  - after touching the face or hair
  - after carrying out any cleaning that could contaminate the hands with bacteria or unsuitable chemicals
- 2. Report any of the following illnesses which you suffer to your Manager;
  - All cases of diarrhoea and/or vomiting
  - Enteric fever i.e. Typhoid or Paratyphoid
  - VTEC Escherichia coli (usually E.coli 0157)
  - Hepatitis A
  - Skin condition i.e. lesions on exposed areas of the skin that are actively weeping or discharging
  - Infections of eyes, ears or mouth
- 3. Do not work if you are suffering from diarrhoea and/or vomiting and report this to your Manager immediately.
- 4. Do not handle food if you have scaly or infected lesions on your skin which cannot be totally covered during food handling.
- 5. Ensure cuts and abrasions on exposed areas are totally covered with a distinctively coloured waterproof dressing
- 6. Do not spit in food handling areas
- 7. Do not smoke in food handling areas.
- 8. Do not eat or chew gum in food handling areas
- 9. Wear clean protective over-clothing, including headgear.
- 10. Ensure work surfaces and utensils are clean.

Taken from: Food Handlers: Fitness to Work
Guidance for Food Business Managers
Published by the Department of Health 1996

### **Practical Tips**

- High risk food being stored in the fridge or freezer and must be kept covered to avoid contamination
- Food which has been frozen and then defrosted must be redated with a date on which it was defrosted or a revised use by date
- ❖ You must ensure that you check packaging for specific storage temperatures. It is vital that fish such as fresh tuna is stored at or below 4°C to minimise the risk of food poisoning toxins. Some vacuum-packed cooked meats also specify that the meat must be kept at or below 5°C.
- Sauces such as mayonnaise must be kept refrigerated once they have been opened. If you are unsure check on the labelling
- Opened cans must not be stored in the fridge. Food must be decanted into a container with a lid or covered with cling film etc. before being placed in the fridge.
- Vacuum packs of meat once opened must be used within 3 days. The use by date printed on the pack refers to the unopened pack.

### THE MOST COMMON HAZARDS RELATING TO FOOD POISONING

HAZARD	CONTROL
Preparation of food too far in advance and storage at room temperature leading to multiplication of bacteria	<ul> <li>Store food below 8°C or above 63°C</li> <li>Prepare minimum amount of food</li> <li>Minimise time the food is at room temperature during preparation</li> <li>Staff training on personal hygiene</li> <li>Cleaning and disinfection of food contact surfaces prior to preparation</li> </ul>
Cross contamination	<ul> <li>Raw and high risk food to be segregated at all stages from delivery to service</li> <li>Separate food contact surfaces/equipment (colour coded)</li> <li>Effective cleaning and disinfection</li> <li>High standard of personal hygiene</li> <li>Effective pest control</li> </ul>
Undercooking	<ul> <li>Centre temperature at least 75°C</li> <li>Frozen meat thawed prior to cooking</li> <li>Training of staff</li> </ul>
Inadequate cooling leading to multiplication of bacteria	<ul> <li>Food to be cooled to below 8°C within 1.5 hours</li> <li>After cooling, store food in a refrigerator below 5°C</li> </ul>
Inadequate reheating	Reheat to greater than 75°C
Improper hot holding	<ul> <li>All food maintained above 63°C</li> <li>Prepare minimum amount of food</li> <li>Prevent contamination</li> </ul>
Infected food handlers	<ul> <li>Pre-employment medical questionnaire/ screening</li> <li>Prohibited from handling food for at least 48 hours after symptoms have cleared</li> <li>High standards of personal hygiene</li> <li>Staff training, especially reporting of illness (sickness/diarrhoea) and handwashing</li> </ul>

#### TRAINING

It is a legal requirement for the proprietor of a food business to ensure that all food handlers engaged in the food business are supervised and instructed and/or trained in food hygiene matters appropriate with their work activities. Those responsible for the development and maintenance of the HACCP food safety management system must also now receive adequate training in the application of HACCP principles.

The appropriate level of knowledge required to meet the legal requirements will vary depending upon what level of work activity is carried out by the food handler and should be in fitting with the level of knowledge and competence required to perform the activity safely. Further guidance on appropriate levels of supervision, instruction and training is given within the various industry guides listed in of this publication.

#### **Examples of the Training Required for Different Types of Job:**

Who?	When?	What Training?
All food handlers	Before starting work for the first time	Introductory Training including: - personal hygiene; - how to carry out their duties hygienically - what to do if they have an illness such as a stomach upset New employees should work under close supervision until they have received more detailed training.
Staff who handle wrapped/pre-packed or "low risk" food only	Within 4 weeks of starting a job (8 weeks for part-time staff)	Hygiene Awareness Instruction, this should include:  - the importance of food hygiene, cleanliness, etc.  - the causes of food poisoning;  - personal hygiene, reporting illness, etc.  - food storage, temperature control and stock rotation;  - foreign body contamination;  - awareness of pests (rats, mice and insects)
Food handlers who prepare or serve high risk "open" food, e.g. cook, baker, shop assistant handling cooked meats or serving unwrapped cream cakes, person working in a café or takeaway	Within 4 weeks of starting a job	Hygiene Awareness Instruction, this should include:  - the importance of food hygiene, cleanliness, etc.  - the causes of food poisoning;  - personal hygiene, reporting illness, etc.  - food storage, temperature control and stock rotation;  - foreign body contamination;  - awareness of pests (rats, mice and insects)  Level 2 (Foundation Certificate in Food Hygiene Course or equivalent) Duration approximately 6 hours

Who?	When?	What Training?
Managers and	Within 3	Level 2 (Catering Certificate in Food Hygiene
Supervisors	months	course or equivalent). Duration approximately
		6 hours. In larger businesses more detailed
		training to
		<b>Level 3</b> (Intermediate – 12 to 24 hours) or

#### **Food Hygiene Courses**

The Level 2 Food Hygiene Course is a 6-hour course usually completed in one day. This is an ideal introduction into food hygiene for all food handlers. The course can be tailored to suit the individual client's needs. Candidates who successfully complete a multiple-choice questionnaire are awarded the Foundation Certificate in Food Hygiene.

Refresher training for food hygiene, a half-day course strongly recommended for anyone who completed the Foundation Food Hygiene Course more than 3 years ago. This is to ensure food handlers are kept up to date in the latest developments and good practices. Candidates who successfully complete the course will receive a certificate.

The Level 3 Intermediate Food Hygiene Course is designed for supervisors or managers who require further training in Food Hygiene. It comprises of 18 hours of training and candidates who achieve at least 60% from the 2-hour multi-choice exam are awarded the Intermediate Food Hygiene Certificate.

Hazard Analysis – Principles and Practice. This is a 1½-day course designed for Supervisors/Managers who are required to carry out Hazard Analysis as part of their duties. Successful candidates will be awarded an accredited qualification in Hazard Analysis.

### Training records

List details of staff, roles, responsibilities and training received and required.

Name	Training received	Role	Responsibility	Comments

If you are experiencing problems or do not understand what you must do in order to comply with the HACCP requirement, contact your inspecting officer to discuss your progress. We would be pleased to provide further assistance.
